Gold Rally Is No Flash in the Pan

When it comes to investing, gold may be the antithesis of artificial intelligence (AI). The precious metal has acted as a store of value for thousands of years with zero technological innovation — gold is discovered, not developed. Gold is also a real tangible asset and can act as a potential hedge against inflation or a safe haven during times of crisis. Given these properties and the backdrop of a risk-on-record-setting equity market, many investors are wondering what's behind the paradoxical price action of gold's rally to new highs and how the yellow metal has matched the momentum in AI stocks over the last several months (gold and the equal-weight Magnificent Seven Index are both up around 20% since March). Herein we discuss the key drivers of gold and why this rally is no flash in the pan.

Melt Up in Gold

After consolidating sideways for several years, spot gold prices finally reached record highs in March. The rally continued into the summer months as expectations for a monetary policy pivot from the Federal Reserve (Fed) firmed. Interest rates and the dollar subsequently declined as the market began to price in higher probabilities for rate cuts. This was an expected response from gold, as lower U.S. interest rates and a weaker dollar increased the appeal of non-yielding bullion.

Perhaps more surprising is the lack of demand for

gold exchange-traded funds (ETFs). Until recently, ETF holdings of gold had inexplicably decoupled from the precious metal over the last two years. However, with gold breaking out to new highs and creating a lot of headlines along the way, fear of missing out appears to be kicking in. Buyers have returned to chase this rally as gold ETF holdings recently reported seven straight weeks of positive inflows, marking the longest inflow streak since March 2022. History suggests this trend could continue as peaks in gold ETF holdings tend to occur after peaks in gold prices.

Gold Rallies to Record Highs as Inflows Into Gold ETFs Return

A weaker dollar and declining interest rates have played leading roles in gold’s rally to record highs. However, in recent years, central banks have increasingly played a supporting role. According to the World Gold Council, global central banks purchased record levels of gold in 2022, followed by near-record-level buying in 2023. More recently, global central banks bought 183 tonnes of gold in the second quarter, marking a 6% increase compared to last year. Rising demand has been driven by foreign central banks diversifying away from dollar reserves, partially due to worries about escalating U.S. deficits, and perhaps more significantly, concerns over the potential seizure of reserve assets by the U.S. government — as Russia witnessed after the 2022 invasion of Ukraine.

While the chart below highlights the increased impact central banks have had on aggregate gold demand, they are not the only ones buying the precious metal. According to the Commodity Futures Trading Commission (CFTC), managed money long positions (typically speculators, hedge funds) in gold recently reached their highest level since March 2020. Over-the-counter demand for gold has also jumped higher. India, the world’s second-largest consumer of gold jewelry, cut the import tax on gold to 6% from 15% in July. Imports of gold tripled the following month as Indian buyers ramped up purchases ahead of Diwali and wedding season this fall, where gold is often given as a traditional gift.

Increased Central Bank Buying Support Gold Demand

Rate Cuts vs. Gold

Rate cuts generally imply lower yields and a potentially weaker dollar — a recipe for stronger gold prices as other income-generating safe haven assets become less competitive and the commodity becomes cheaper to purchase. And while inflation is falling, potentially reducing the allure of gold as an inflation hedge, the direction of interest rates, central bank demand, and the geopolitical climate tend to have more of an impact on the yellow metal.

Of course, the Fed has a significant impact on interest rates, and with the pivot to rate cuts officially underway, we analyzed how gold performed after the Fed started cutting rates. Based on the last nine major rate-cutting cycles since the 1970s, gold has generated an average 12-month gain of 3.7% following the first rate cut. The peak in gold performance has historically been around the six-month window, where average gains reached 10.8%, suggesting current upside momentum could continue at least into the first quarter of next year.

Rate Cuts Supportive of Gold

Disclosures: Any futures referenced are being presented as a proxy, not as a recommendation. Past performance is no guarantee of future results. Progression data based on first Fed rate cuts in 1974, 1980, 1981, 1984, 1989, 1995, 2001, 2007, 2019

Summary

Gold has climbed to new highs amid a backdrop of building broad-based demand, falling yields, a weaker dollar, and elevated geopolitical risk. Momentum could continue as the yellow metal has historically posted strong six-month returns after rate-cutting cycles begin. LPL's Strategic and Tactical Asset Allocation Committee (STAAC) maintains a positive outlook on precious metals.

The Committee maintains its neutral stance on equities, though, with a slightly negative bias in the very short term based on the S&P 500 approaching overbought levels with deviating market breadth, historical seasonal weakness in October during election years, and political and geopolitical uncertainty. The STAAC expects volatility to remain elevated in the coming months as the market waits for more clarity on the economy, elections, and a better seasonal setup. For fixed income, the STAAC recommends a modest overweight, funded from cash, with an up-in-quality approach and benchmark-level interest rate sensitivity.
